

Version: 2.0

Secure Data Acquisition Data Sheet

January 2018
Author: Maytech

Outline

A Maytech widget embeds a fast and secure file upload facility into your corporate website, customised to capture any form field metadata you require simultaneously with the files.

An automated notification is triggered on upload and files are written to a logical folder structure you define. File transfers through the widget support strong security and compliance credentials and provide a detailed audit trail.

How it works

Widget Functionality

The Customer Facing Form

Widgets are highly configurable to meet any interactive data acquisition need. They can be arranged in any layout to suit your requirements and can include any standard HTML form fields including:

- Text inputs and text areas
- Radio buttons and checkboxes
- Option lists
- Prefilled hidden fields

Fields may be set to optional or compulsory and can include Javascript validation.

Dynamic widgets can be set to pre-populate or generate field values from URL parameters and CREDITS, CASE STUDIES & PORTFOLIO and include Javascript generated content.

Folder Organisation for Uploaded Files

Uploaded files are written to your Maytech storage area, folders can be automatically created for uploaded files using values from form fields or any system value.

Upload Notifications

Email notifications (to one or many recipients) are triggered when an upload completes, the mail is composed of:

- An optional text header
- The list of files uploaded (with links to download)
- The form data including data entered interactively or passed to hidden fields from URL parameters

Alternatively we can integrate with your CRM by making a SOAP or JSON call to your systems.

Confirmatory response mails

End users can receive a confirmation email on completion of the upload, the recipient can be set to a form field value.

Collecting uploaded files

Uploaded files can be downloaded interactively or in a batch process, usually over SFTP.

PCI Compliance

Maytech is ISO 27001 (Information Security Management Systems) accredited by Lloyds Register QA. Services hosted at our EU and US data centres are PCI-Compliant.

Control of data residency is compliance critical - data is stored at the data centre of your choice, we never backup or otherwise replicate data outside of your chosen data centre.

How We've Helped

Maytech customers deploy widgets in a range of business data flows, just a few examples:

- Artwork and order detail acquisition for print order workflows.
- Credit card validation data.
- Membership applications and updates.
- Insurance claim photos and data.
- Competition submissions.

Widget Plans

Widgets are available in four tiers and the functionality is shown in the table below.

Function	Ad-hoc			Dynamic	
	Basic	Custom	Specialist	Low	High
Custom Value Fields	✓	✓	✓	✓	✓
Compulsory Fields	✓	✓	✓	✓	✓
Custom Styling	-	✓	✓	✓	✓
Structured Destination Folders	-	✓	✓	✓	✓
Field validation	-	-	✓	✓	✓
Order Process Integratio	-	-	✓	✓	✓
Smart fields (hidden/prepopulated)	-	-	-	✓	✓
End user confirmation notifications	-	-	-	✓	✓

Pricing

Widgets are licensed for a 1 to 3 year period. | P.O.A.
